Certificate of Analysis

Standard Reference Material[®] 1640

Trace Elements in Natural Water

This Standard Reference Material (SRM) is intended primarily for use in evaluating methods used in the determination of trace elements in fresh water. SRM 1640 is composed of natural fresh water collected from Clear Creek, CO, which has been filtered and stabilized with nitric acid at a concentration of 0.5 mol/L. A unit of SRM 1640 consists of approximately 250 mL of solution in a polyethylene bottle, which is sealed in an aluminized plastic bag.

Certified Values and Uncertainties: The certified values expressed as mass fractions and their expanded uncertainties are listed in Table 1 for 17 elements in SRM 1640. The certified values are equally weighted means of the results of two or more independent analytical methods or a single primary method. Each expanded uncertainty is based on a 95 % confidence interval for the mean, and includes an allowance for differences between the analytical methods used and an allowance for solution stability [1].

Reference Values and Uncertainties: The reference values expressed as mass fractions and their expanded uncertainties are provided in Table 2 for an additional ten elements. The reference values are means from a single method or two or more equally weighted means of results of independent analytical methods for which there is insufficient information to meet NIST certification criteria. Each expanded uncertainty is based on a 95 % confidence interval for the mean and includes an allowance for differences between the analytical method used and an allowance for solution stability but may not include all sources of uncertainty [1].

Information Value: The upper limit information value for thallium, expressed as a mass fraction in Table 3, is an estimate based on the instrumental limit of detection and measurements from a single unit of SRM 1640.

The analytical methods used for the characterization of this SRM are given in Table 4. All values are reported as mass fractions [2].

NOTICE AND WARNINGS TO USERS

Expiration of Certification: This certification of this SRM lot is valid until **01 June 2008**, within the measurement uncertainties specified, provided the SRM is handled and stored in accordance with the instructions given in this certificate (see "Use"). However, the certification will be nullified if the SRM is contaminated or modified. Registration (see attached sheet) will facilitate notification.

Use: The SRM should be shaken before use because of potential water condensation. Samples should be analyzed at a room temperature of $22\text{ }^{\circ}\text{C} \pm 5\text{ }^{\circ}\text{C}$. To prevent possible contamination of the SRM, pipettes should not be inserted into the bottle. After use, the bottle should be recapped tightly and returned to the aluminized bag, which should be folded and sealed with sealing tape. This precaution will protect the SRM from possible environmental contamination and long-term evaporation.

The mass fractions given in Tables 1 and 2 are expressed as microgram per kilogram or milligram per kilogram. These values can be converted to mass concentrations with units of nanograms per cubic centimeter or micrograms per cubic centimeter, respectively, by multiplying by the density. The density of SRM 1640 at $22\text{ }^{\circ}\text{C}$ was measured to be $1.0015\text{ g/cm}^3 \pm 0.0005\text{ g/cm}^3$ (identical to grams per milliliter).

Coordination of the NIST technical measurements was under the direction of J.R. Moody of the NIST Analytical Chemistry Division.

Stephen A. Wise, Chief
Analytical Chemistry Division

Gaithersburg, MD 20899
Certificate Issue Date: 20 January 2006
See Certificate Revision History on Last Page

Robert L. Watters, Jr., Chief
Measurement Services Division

Statistical analysis of the experimental data was performed by W.F. Guthrie of the NIST Statistical Engineering Division.

The overall coordination of measurements performed by the U.S. Geological Survey National Water Quality Laboratory, Arvada, CO, and by laboratories that participate in the Standard Reference Water Program was under the direction of K. Long.

The support aspects involved in the issuance of this SRM were coordinated through the NIST Measurement Services Division.

Recognizing contamination at the microgram per kilogram level can be a serious problem, labware should be scrupulously cleaned and only high purity reagents employed. Sampling and manipulations, such as evaporations, should be done in a clean environment, such as a Class-100 clean hood.

Table 1. Certified Mass Fractions

Element	µg/kg	Element	µg/kg
Aluminum	52.0 ± 1.5	Iron	34.3 ± 1.6
Antimony	13.79 ± 0.42	Lead	27.89 ± 0.14
Arsenic	26.67 ± 0.41	Manganese	121.5 ± 1.1
Barium	148.0 ± 2.2	Molybdenum	46.75 ± 0.26
Beryllium	34.94 ± 0.41	Selenium	21.96 ± 0.51
Boron	301.1 ± 6.1	Silver	7.62 ± 0.25
Cadmium	22.79 ± 0.96	Strontium	124.2 ± 0.7
Chromium	38.6 ± 1.6	Vanadium	12.99 ± 0.37
Cobalt	20.28 ± 0.31		

Table 2. Reference Mass Fractions

Element	µg/kg	Element	mg/kg
Copper	85.2 ± 1.2	Calcium	7.045 ± 0.089
Lithium	50.7 ± 1.4	Magnesium	5.819 ± 0.056
Nickel	27.4 ± 0.8	Silicon	4.73 ± 0.12
Potassium	994 ± 27	Sodium	29.35 ± 0.31
Rubidium	2.00 ± 0.02		
Zinc	53.2 ± 1.1		

Table 3. Information Mass Fraction

Thallium	<0.1 µg/kg
----------	------------

Source and Preparation of Material: A sample of about 3500 L of natural (fresh) water was obtained by the USGS at Clear Creek, CO. It was filtered through a 0.1 µm ultra filter and acidified with nitric acid. Analysis of the water by inductively coupled plasma mass spectrometry (ICPMS), before and after the stabilization process, showed that arsenic, beryllium, cobalt, selenium, and zinc were decreased in concentration during the stabilization process. These elements were adjusted to their original concentration levels by the addition of salts of the decreased elements. The stabilized solution was then pumped through an ultra filter, past a UV light source (for sterilization purposes), and then to a bottling station. At the bottling station, the bottles were rinsed with the sample and then filled.

Table 4. Methods Used for the Analysis of SRM 1640

Elements	Methods
Aluminum	DCP, ETAAS, ICP-AES, ICPMS
Antimony	ETAAS, Hyd-AAS, ICP-AES, ICPMS
Arsenic	ETAAS, Hyd-AAS, ICP-AES, ICPMS
Barium	DCP, ETAAS, ICP-AES, ICPMS, ID-ICPMS
Beryllium	ETAAS, ICP-AES, ICPMS
Boron	COLOR, ICP-AES, ICPMS, ID-TIMS
Cadmium	ETAAS, FAAS, IC, ICP-AES, ICPMS, ID-ICPMS
Calcium	DCP, FAAS, ICP-AES, ICPMS
Chromium	ETAAS, FAAS, IC, ICP-AES, ICPMS
Cobalt	ETAAS, ICP-AES, ICPMS
Copper	ETAAS, FAAS, IC, ICP-AES, ICPMS, ID-ICPMS
Iron	ETAAS, FAAS, ICP-AES, ICPMS, ID-TIMS
Lead	ETAAS, FAAS, IC, ICP-AES, ICPMS, ID-ICPMS
Lithium	ETAAS, FAAS, ICP-AES, ICPMS
Magnesium	DCP, FAAS, ICP-AES, ICPMS
Manganese	DCP, ETAAS, FAAS, ICP-AES, ICPMS
Molybdenum	ETAAS, ICP-AES, ICPMS, ID-ICPMS
Nickel	ETAAS, FAAS, ICP-AES, ICPMS, ID-ICPMS
Potassium	ETAAS, FAAS, FES, ICP-AES, ICPMS
Rubidium	ID-TIMS
Selenium	EAAS, Hyd-AAS, ICP-AES, ICPMS
Silicon	COLOR, ICP-AES, ICPMS
Silver	ETAAS, FAAS, ICP-AES, ICPMS, ID-ICPMS
Sodium	DCP, FAAS, FES, ICP-AES, ICPMS
Strontium	DCP, ETAAS, ICP-AES, ICPMS, ID-ICPMS
Thallium	ICPMS
Vanadium	ETAAS, ICP-AES, ICPMS
Zinc	FAAS, IC, ICP-AES, ICPMS, ID-ICPMS

Methods given in bold indicate that a single NIST primary method was used for certification.

Methods

COLOR	Colorimetry
DCP	Direct current plasma atomic emission spectrometry
ETAAS	Heated graphite atomizer (electrothermal) atomic absorption spectrometry
FAAS	Flame atomic absorption spectrometry
FES	Flame emission spectrometry
Hyd-AAS	Hydride generation-atomic absorption spectrometry
IC	Ion chromatography
ICP-AES	Inductively coupled plasma-atomic emission spectrometry
ICPMS	Inductively coupled plasma mass spectrometry
ID-ICPMS	Isotope dilution-inductively coupled plasma mass spectrometry
ID-TIMS	Isotope dilution-thermal ionization mass spectrometry

Contributing Laboratories and Analysts:

E.S. Beary, M.S. Epstein, K.E. Murphy, P.J. Paulsen, and G.C. Turk; NIST Analytical Chemistry Division, Gaithersburg, MD
Water Resources Division and approximately 70 laboratories participating in the Standard Reference Water Program, under the direction of K. Long; U.S. Geological Survey, Arvada, CO
P. Taylor, L. Van Nevel, I. Lapitajs, A. Kynartren, A. Held, U. Örnemark, and P. De Bièvre; Institute for Reference Materials and Measurements, Geel, Belgium
M. Morita; Regional Environmental Division of the National Institute for Environmental Studies, Japan Environmental Agency, Tsukuba, Japan
